1 General Information

1.1 Documentation

The following documents are associated with this document:

- The data sheet describes the technical data, the dimensions, the pin assignment, the accessories and the order key.
- The installation instructions describe the mechanical and electrical installation with all safety-relevant conditions and the associated technical specifications.
- The User manual for actuator commissioning and integration into a fieldbus system.

You can also download these documents at <http://www.siko-global.com/p/ap20s>.

Additional information and guidance regarding this device can also be found there.

1.2 Definitions

If not explicitly stated otherwise, decimal values are given as figures without an extension (e.g. 1234), binary values are marked after the figure with a b (e.g. 1011b), hexadecimal values with an h (e.g. 280h). Individual bits of larger logic units are named with their value after a dot (e.g., CW.9; control word bit 9).

1.3 Intended use

For the further functional description, normal operation of the system with unchanged factory setting is assumed unless otherwise described.

The present device is an absolute position indicator with integrated Industrial Ethernet interface and a plug-in connection for MS500H magnetic sensor for direct linear distance measurement (combined with MB500 magnetic tape) or a supported GS04 hollow shaft sensor for direct shaft mounting. Indicators, control buttons and interface are only active with external power supply. The sensor of measurement encoder works magnetically incrementally. Without an external power supply, encoder changes are recorded with battery support. The status of the replaceable battery is monitored. A volatile target value can be displayed below the actual value via the backlit two-line LC display. A direction display (indicator) is displayed if there is a deviation between the actual value and the target window (target value including Target Window parameter). The indicator direction indicates in which direction the sensor must be moved to reach the target window. In addition, the position status of two two-color LEDs (green and red) is displayed. Device malfunctions or inadmissible operating states are recorded in an error memory. Since both linear magnet sensors and rotary encoders are used with the AP20S, a clockwise direction of rotation must be equated with a positive travel path.

The buttons can be used to select various functions and to adapt the device parameters stored in a non-volatile memory to the application. The actual value can be queried via the interface, the target value can be changed and all device parameters can be adjusted.

1.4 Switching on the operating voltage

The AP20S will be initialized after switching on the supply voltage. A system and display test is executed during initialization, the LEDs are lighted consecutively and the parameters are loaded from the non-volatile memory into the RAM of the controller.

At first use, the default values are used during initialization. After the return of the external power supply or software reset (warm start), the AP20S works with the last saved parameters. Unless a fault has been detected, the AP20S starts normal operation.

2 Display and control keys

2.1 General

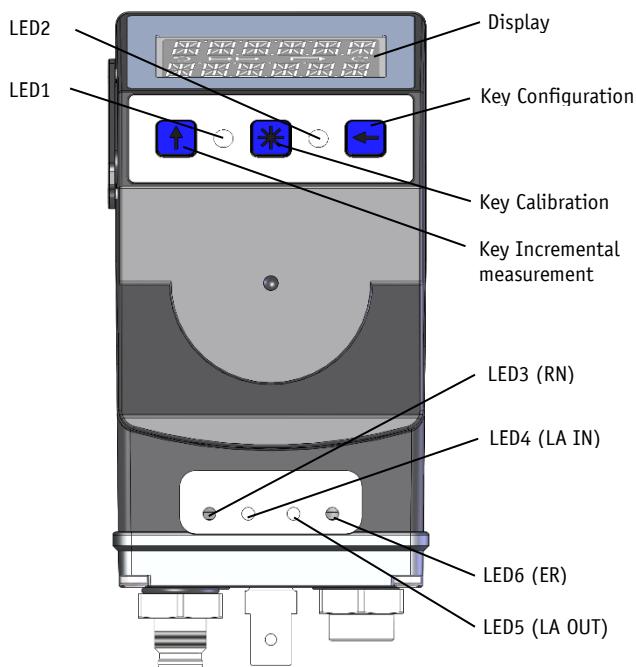

Fig. 1: Display and control elements

2.2 LCD display

NOTICE

The display range is limited to -199999 ... 999999. Values outside this range are displayed with "FULL".

The actual value is displayed in the first line and "----" in the second line. The target value can be declared valid by means of CW.9 = 1 and displayed in the second line. If necessary, a direction indicator (arrow) is also displayed.

The battery status is indicated by the battery symbol . If battery voltage Target value acknowledgment mode critical value, the battery symbol on the display will flash. If the value falls below a minimum value or if the battery is missing, the symbol lights permanently.

With incremental measurement function activated, the incremental measurement symbol  is shown.

This is signaled in red letters in the event of a fault.

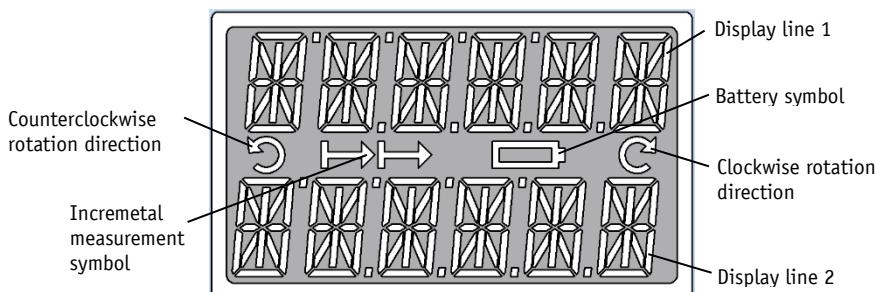

Fig. 2: Two-line 14 segment LCD display

2.2.1 Extended display range

Values up to -199999 can be displayed by means of the control word. If the relevant bit has been set and the value to be displayed is between -199999 and -999999, then the negative sign and the digit of the highest order will flash alternately. If the value range drops below -999999, "FULL" will be displayed.

2.3 LED display

2.3.1 Positioning status

NOTICE

A test sequence is executed on these LEDs during initialization.

When the target value is displayed, the LED1, LED2 inform about a deviation between the actual value and the target window. The function of positioning status LEDs can be configured.

2.3.1.1 Device status LED1, LED2

LED states valid at factory setting.

| LED state | Description |
|-----------|---------------------------------------------------------|
| off | No operating voltage or no valid target value. |
| green | Valid target value, actual value in the target window. |
| red | Valid target value, actual value outside target window. |

In order for LED1 or LED2 to be controlled via the control word, this function of the LEDs must be activated by means of parameters.

2.3.2 EtherCAT module status

NOTICE

A test sequence is executed on these LEDs during initialization.

LED3, LED4, LED5, and LED6 inform about the status of the Ethernet module. The functions of the Ethernet module LEDs are permanently defined and cannot be changed.

2.3.2.1 RUN LED3

| LED state | Description |
|--------------------|-----------------------------------------------------|
| off | EtherCAT® in the INIT state or no operating voltage |
| green | EtherCAT® in the OPERATIONAL state |
| green, flashing | EtherCAT® in the PRE-OPERATIONAL state |
| green, flashing 1x | EtherCAT® in the SAFE-OPERATIONAL state |
| green, flickers | EtherCAT® in the BOOT state |
| red | Fatal error |

2.3.2.2 Link/Activity LED4, LED5

| LED state | Description |
|-----------------|----------------------------------|
| off | no error or no operating voltage |
| green | connection detected, no activity |
| green, flickers | connection detected, activity |

2.3.2.3 Module status LED6

| LED state | Description |
|------------------|-----------------------------------------|
| off | No error or no operating voltage |
| red, flashing | Invalid configuration |
| red, flashing 1x | Unrequested status change |
| red, flashing 2x | Sync Manager Watchdog Timeout |
| red | EtherCAT module in the EXCEPTION status |
| red, flickers | Boot error detected |

2.4 Control keys

Pressing  the Incremental button switches the increment function or a relative measurement on or off.

Pressing  the Calibration button starts the calibration and acknowledges an existing fault. In the "Alphanumeric display" operating mode, the receipt of a set point is acknowledged by this action.

Pressing  the Configuration button starts the parameterization.

See also [Fig. 1.](#)

3 Functional Description

3.1 Operating modes

The following position-dependent operating modes are differentiated: **Absolute position**, **Differential value**, **Modulo** and the position-independent operating mode **Alpha-numeric display**.

3.1.1 Position-bound operating modes

The measured absolute position value is displayed, calculated depending on the Resolution, Display Divisor, Decimal Places and Display Factor parameters. Via the interface, the actual value can be provided to an upstream control and a target value specified.

Absolute position:

Linear absolute actual values are displayed

Line 1: actual value; CW.9 = 0, 2. Line: "----" or CW.9 = 1, Line 2: target value

Calculation of the actual value:

$$\text{Actual value} = \frac{\text{Position value} \times \text{calculation factor}}{\text{Display divisor}} \quad \text{Position value} = \text{internally measured value} + \text{calibration value} + \text{offset value}$$

Differential value display:

A linear absolute actual value and a differential value are displayed. The differential value is calculated as follows: Differential value = actual value – target value.

Line 1: actual value; CW.9 = 0, 2. Line: "----" or CW.9 = 1, Line 2: Differential value

The calculation of the differential value can be set via the parameter Difference Value Mode (see chapter [4.5.8](#)).

Modulo display:

Actual values ranging from 0° to 360° are displayed.

Line 1: actual value; CW.9 = 0, 2. Line: "----" or CW.9 = 1, Line 2: target value

Using the parameter Decimal Places (see chapter [4.2.2](#)) the resolution and the modulo point of the displayed values are set.

| Decimal places | Display resolution | Value range |
|----------------|--------------------|---------------------|
| 0 | 1° | 0°...360° |
| 1 | 1/10° | 0.0°...360.0° |
| 2 | 1/100° | 0.00°...360.00° |
| 3 | 1/1000° | 0.000°...360.000° |
| 4 | 1/10000° | 0.0000°...360.0000° |

Table 1: Modulo display

3.1.1.1 Target window

A target window is formed to be able to define a tolerance range.

Target window = [Target Value ± Target Window](#)

Example Position monitoring:

Target Window = 5

Target Value = 100

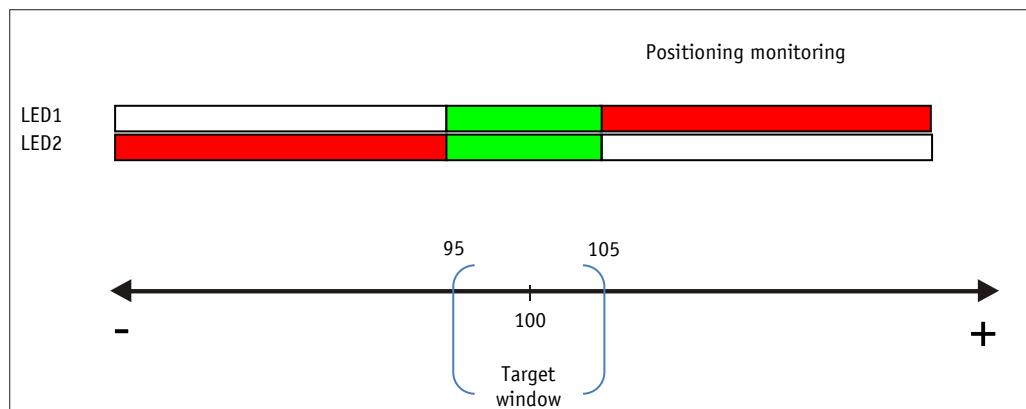

Fig. 3: Positioning monitoring with Target Window

An additional, extended target window and an associated visualization of the extended target window can be additionally parameterized (see chapter [4.2.7](#) or [4.3.4](#)).

Example of position monitoring with additionally activated Target Window Extended parameter:

Target Window Extended = 15

Target Window Extended Visible = 1

Target Value = 100

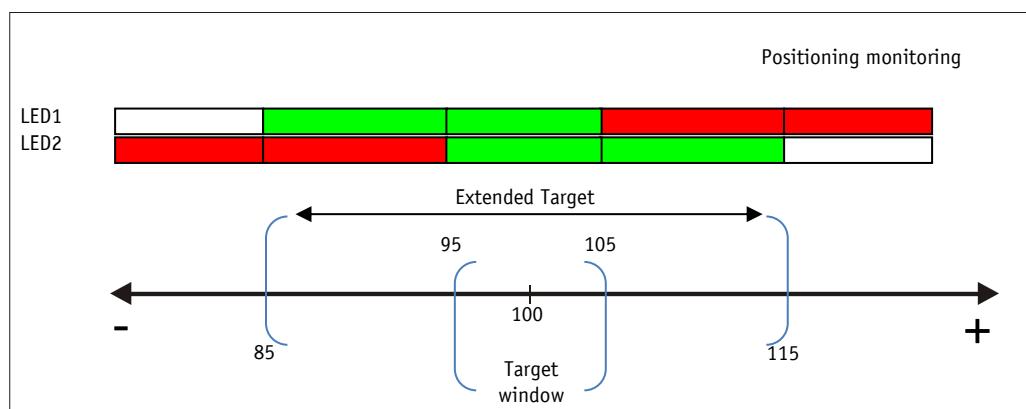

Fig. 4: Positioning monitoring with Target Window Extended

3.1.1.2 Directional arrows

To assist in positioning, direction arrows are displayed in the display as long as the current actual value is outside the valid target window. The arrow direction indicates in which direction the sensor position must be changed to reach the target window.

3.1.1.3 LED display

With factory setting, the LED glows green as long as the actual value is within the programmed window. When leaving target window, the LED glows red. The sensor position must be changed in the direction of the glowing LED in order to arrive at the target value. The red glowing LED1 (left): counter-clockwise (ccw) rotation required. Red glowing LED2 (right): clockwise (cw) rotation required.

With factory settings, the LED display (see Fig. 1) has the following meaning:

| Operating state | LED | Meaning |
|---------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| There is no valid target value or no operating voltage. | Both LEDs inactive | No position monitoring active. |
| There is a valid target value. | Both LEDs green | The actual value is within the programmed target window. |
| | LED1 red | The actual value is outside the programmed target window. The sensor must be moved in negative counting direction in order to reach the target. |
| | LED2 red | The actual value is outside the programmed target window. The sensor must be moved in positive counting direction in order to reach the target. |

Table 2: LED display

3.1.1.4 Loop positioning

NOTICE

Target window is also applied to the loop length.

NOTICE

The behavior of the clearance compensation is independent of the set counting direction of the display. The loop type must be changed to change the clearance compensation.

If the position indicator is operated on a spindle or an additional gear, the spindle or external gear backlash can be compensated by means of loop positioning. Therefore, movement towards the target value is always in the same direction. This direction of approach can be defined.

Example:

The direction, in which each setpoint position is to be moved to, is positive.

- Case1 ⇒ the new position is greater than actual value:
Die Sollposition wird direkt im Uhrzeigersinn (CW) angefahren.
- Case 2 ⇒ the new position is smaller than actual value:
The directional arrows of the position indicator indicate that the loop length is to be moved counterclockwise (CCW) beyond the target position. Then the target value is approached clockwise.

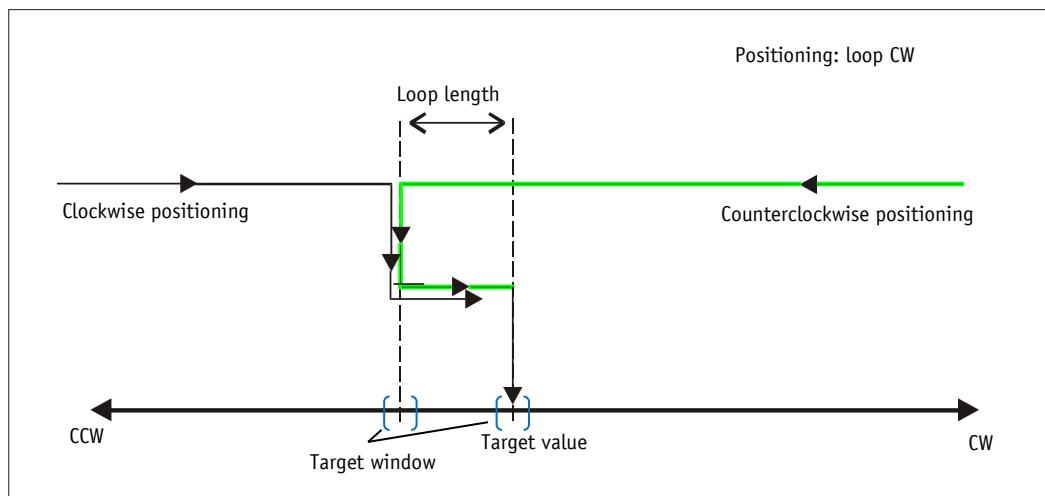

Fig. 5: Positioning Loop CW

3.1.2 Control word: Position-dependent operating modes

The control word consists of 16 bits and differs in function depending on the operating mode.

| Control word | | | | | | | | | | | | | | | | |
|--------------|-----------|----|----|----|----|---|---|---|----------|---|---|---|---|---|---|--|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| MSB | High Byte | | | | | | | | Low Byte | | | | | | | |

The designation of the individual bits of the control word as well as their meaning:

| Bit | Meaning | Value = 0 | Value = 1 |
|-----|-------------------------|-------------------------------------|-------------------------------------------------|
| 0 | Calibration execute | - | Trigger calibration (edge-controlled, positive) |
| 1 | reserved | ever 0 | - |
| 2 | reserved | ever 0 | - |
| 3 | Display range | Normal display area | Extended display area |
| 4 | reserved | ever 0 | - |
| 5 | Error acknowledge | - | Acknowledge error |
| 6 | reserved | ever 0 | - |
| 7 | reserved | ever 0 | - |
| 8 | reserved | ever 0 | - |
| 9 | Target value activation | - | Activate target value |
| 10 | reserved | ever 0 | - |
| 11 | LED1 green | Release via LED parameters required | Deactivate LED |
| 12 | LED1 red | | Activate LED |
| 13 | LED2 green | | Deactivate LED |
| 14 | LED2 red | | Activate LED |
| 15 | LED blinking | | Deactivate LED |

Table 3: Control word operating mode Abs, Diff, Modulo

3.1.3 Status word: Position-dependent operating modes

| | |
|---------------|----------------------------------------------------------------------------------------------|
| NOTICE | The response to a target write command contains a status word that has not yet been updated. |
|---------------|----------------------------------------------------------------------------------------------|

The Status Word shows the current status of the AP20S. It is composed of eight bits.

| Status word | | | | | | | | | | | | | | | | |
|--------------------|-----------|----|----|----|----|---|---|---|----------|---|---|---|---|---|---|--|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| MSB | High Byte | | | | | | | | Low Byte | | | | | | | |

The designation of the individual bits of the control word as well as their meaning:

| Bit | Meaning | Value= 0 | Value= 1 |
|------------|-------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|
| 0 | Direction indication CW | Target value counterclockwise or in positive direction | Target value clockwise or in negative direction |
| 1 | Direction indication CCW | Target value clockwise or in negative direction | Target value counterclockwise or in positive direction |
| 2 | Calibration executed | No calibration is currently being carried out | A calibration is currently being carried out |
| 3 | Target window extended reached | Extended target window is not reached | Extended target window is reached |
| 4 | reserved | ever 0 | - |
| 5 | Target window reached | Target window is not reached | Target window is reached |
| 6 | Deviation | Deviation Actual value <= target value | Deviation Actual value > target value |
| 7 | General error | No error | There is an error |
| 8 | reserved | ever 0 | - |
| 9 | Actual value = incremental measurement | Increment measurement is deactivated | Increment measurement is activated |
| 10 | Target value activation | Target value is not activated | Target value is activated |
| 11 | Battery state | Battery Charging state is OK | Battery Charging state is critical |
| 12 | Sensor error | There is no sensor error | There is a sensor error |
| 13 | Key Configuration  | Button is not pressed | Button is pressed |
| 14 | Key Calibration  | Button is not pressed | Button is pressed |
| 15 | Key Incremental  | Button is not pressed | Button is pressed |

Table 4: Status word operating mode Abs, Diff, Modulo

3.1.4 Alpha-numeric display operating mode

Two 6-digit target values can be displayed in this operating mode. With factory settings, the target values are acknowledged by pressing the  key (see chapter 2.4 and parameter 4.5.16).

Alpha-numeric display:

Both lines are freely writable. The content of the display line can be transmitted via the Display Data parameter, and the content of the display line can be transmitted via the Target Value parameter. In this case, the bit for data identification must be set correctly in the respective control word. The data identifier is used to distinguish whether the data is interpreted and displayed as a number or as an alphanumeric character (ASCII) (see chapter [4.2.10](#), [4.2.12](#) and [4.5.2](#)).

Alternatively, you can write directly in each display line using the Display String parameter in connection with the respective Display String1 or Display String2 (see chapter [4.5.2](#), [4.5.5](#) and [4.5.6](#))

LCD display:

If there is no valid target value, the 1st display line is displayed blank. "----" appears in the 2nd display line.

A valid target value is displayed flashing until its receipt is acknowledged. If neither target value has been acknowledged, both values are acknowledged jointly by pressing the  key.

LED display:**Status LED1 and LED2:**

With factory settings, the LED display (LED1, LED2) works according to the following table.

| Operating state | State | Meaning |
|---------------------------------|---------------|-------------------------------|
| There is no valid target value. | Both LEDs off | |
| There is a valid target value. | LED1 red | Display data not acknowledged |
| | LED1 green | Display data acknowledged |
| | LED2 red | Target value not acknowledged |
| | LED2 green | Target value acknowledged |

Table 5: Status LED display in the alpha-numeric display operating mode

3.1.5 Control word: Alpha-numeric display operating mode

In the control word, the relevant type (number or character string) and the validity of the target value is transmitted to the display. As an additional option, the target value can be acknowledged via the control word.

The control word is composed of 16 bits.

| Control word | | | | | | | | | | | | | | | |
|--------------|-----------|----|----|----|----|---|---|---|---|---|---|---|---|---|-----|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MSB | High Byte | | | | | | | | | | | | | | LSB |

The designation of the individual bits of the control word as well as their meaning:

| Bit | Meaning | Value = 0 | Value = 1 |
|-----|----------|-----------|-----------|
| 0 | reserved | ever 0 | - |
| 1 | reserved | ever 0 | - |

| Bit | Meaning | | Value = 0 | Value = 1 |
|------------|---------------------------------------------------|-----------------------------------------------|------------------------------------|-------------------------------------------|
| 2 | Display data activation (display line 1) | | - | Activate Display data |
| 3 | Display range | | standard | extended |
| 4 | reserved | | ever 0 | - |
| 5 | Error acknowledge | | - | Acknowledge error |
| 6 | Target value acknowledgment mode (display line 2) | | Manually acknowledge target value | Acknowledge target value |
| 7 | Target value data type (display line 2) | | Interpret target value as a number | Interpret target value as ASCII character |
| 8 | Display data type (display line 1) | | Interpret display data as a number | Interpret display data as ASCII character |

Table 6: Control word alpha-numeric display operating mode

3.1.6 Status word: Alpha-numeric display operating mode

| | |
|---------------|----------------------------------------------------------------------------------------------|
| NOTICE | The response to a target write command contains a status word that has not yet been updated. |
|---------------|----------------------------------------------------------------------------------------------|

Type, validity and acknowledgment status of the target values are fed back in the status word.

The status word is composed of 16 bits.

| Status word | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|-----|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| MSB | | | | | | | | Low Byte | | | | | | | | LSB |

The designation of the individual bits of the control word as well as their meaning:

| Bit | Meaning | | Value = 0 | Value = 1 |
|------------|--------------------------------------------|--|-------------------------------|---------------------------|
| 0 | reserved | | ever 0 | - |
| 1 | reserved | | ever 0 | - |
| 2 | Display data activation (display line 1) | | Display data deactivated | Activate display data |
| 3 | Target value acknowledged (display line 2) | | Target value not acknowledged | Target value acknowledged |
| 4 | reserved | | ever 0 | - |

| Bit | Meaning | Value = 0 | Value = 1 |
|-----|-----------------------------------------------------------------------------------------------------|------------------------------------------|----------------------------------------------------|
| 5 | Display data acknowledged (display line 1) | Display data not acknowledged | Display data acknowledged |
| 6 | reserved | ever 0 | - |
| 7 | General error | No error | An error exists |
| 8 | Display data format (display line 1) | Display data are interpreted as a number | Display data are interpreted as an ASCII character |
| 9 | Target value format (display line 2) | Target value is interpreted as a number | Target value is interpreted as an ASCII character |
| 10 | Target value activation (display line 2) | Target value is deactivated | Target value is activated |
| 11 | Battery state | Battery Charging state is OK | Battery Charging state is critical |
| 12 | Sensor error | There is no sensor error | There is a sensor error |
| 13 | Key Configuration  | Button is not pressed | Button is pressed |
| 14 | Key Calibration  | Button is not pressed | Button is pressed |
| 15 | Key Incremental  | Button is not pressed | Button is pressed |

Table 7: Status word alpha-numeric display operating mode

3.2

Battery buffering

Without an external power supply, encoder changes are recorded with battery support. Depending on the duration of battery operation (including storage) and the frequency of adjustments without an external power supply, the battery life is approximately 8 years. Battery voltage is checked at intervals of approx. 10 min. If battery voltage drops below a specified value, the battery symbol  will blink on the display. If the battery voltage continues to drop,  will be displayed permanently. The battery should be replaced within approx. three months after the first appearance of the battery symbol. For battery replacement it is mandatory to follow the instructions of the installation instructions. Replacement can also take place at the SIKO distribution partners or in the SIKO main plant.

Behavior of the status word

The charge status of the battery is signified in the status word. In the case of a critical charging voltage, bit 11 is set, and in the case of an empty or non-existing battery, a fault is additionally signaled with bit 7.

3.3

Parameterization of the position indicator

The position indicator can be fully parameterized via the bus interface. All parameters can also be set manually with the help of the keyboard.

3.3.1 Manual parameterization

3.3.1.1 Starting parameterization

The time until menu release is displayed when the button is pressed. Parameterization starts if it is actuated for the duration of the enable time (see chapter [2.4](#) and [4.5.15](#)).

3.3.1.2 Value input

Enter values via the key and the key. Confirm values entered by pressing the key.

- decimal place selection key

- value input key

3.3.1.3 Value selection

For some parameters you can select values from a list.

Direct value input is not possible there.

Pressing the key, the value can be selected from the list. By pressing the key, the selection is confirmed.

3.3.1.4 Overview of the operating menu

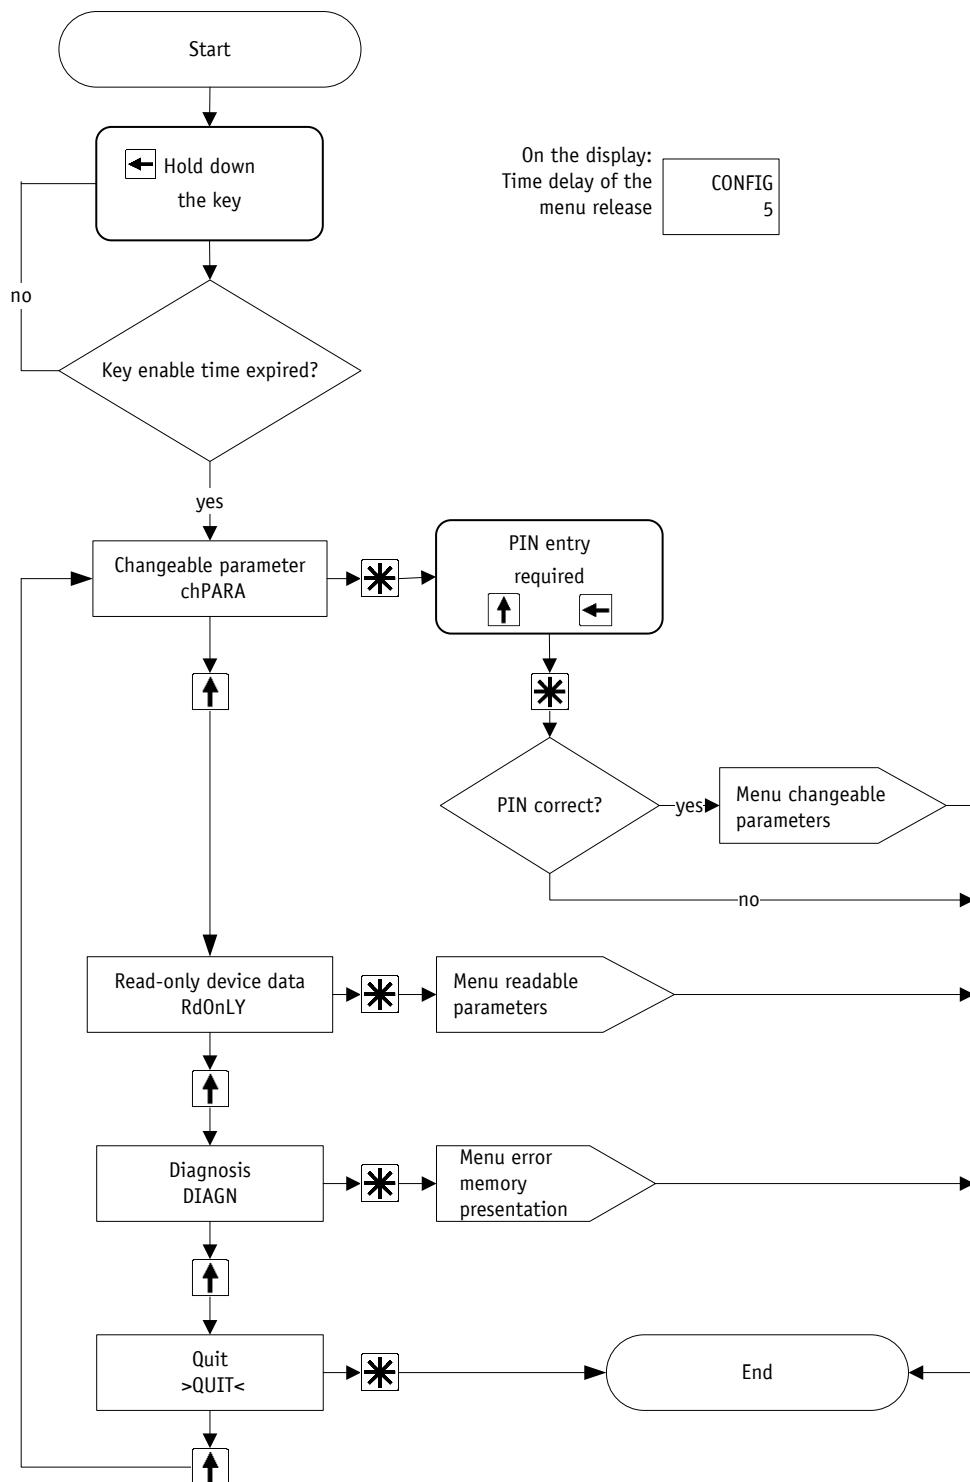

Fig. 6: Operating menu

All device parameters can be viewed and changed in the "Changeable parameters" ("chPARA") submenu (see chapter 3.3.1.5).

All fixed device data are displayed in the "Readable parameters" (Read Only = "RdOnLY") submenu (see chapter 3.7.1).

The "Diagnosis" ("DIAGN") submenu provides various diagnostic options (see chapter 3.7.2).

3.3.1.5 "Changeable parameters" menu

When choosing the "Changeable parameters" submenu, a PIN must be entered first. In the standard delivery condition, this is: "00000".

After confirming the correct PIN, you can choose among the following parameter menus.

| Description | Display | Chapter |
|----------------|-------------|--------------------------|
| Quick Setup | QUICK SETUP | 3.3.1.6 |
| Sensor type | SENSOR | 4.5.2 |
| EtherCAT | SETECT | 3.3.1.7 |
| Positioning | POSI | 3.3.1.8 |
| Visualization | VISUAL | 3.3.1.9 |
| LED function | LEDS | 3.3.1.10 |
| Device options | OPTION | 3.3.1.11 |
| Menu end | <QUIT> | |

Table 8: "Changeable parameters" menu structure

3.3.1.6 Quick Setup

The following parameters can be set in the QUICK SETUP menu:

| Description | Display | Chapter |
|-------------------------------|---------------------|-----------------------|
| Display direction | DISPL | 4.3.1 |
| Sensor type | SENSOR | 4.5.2 |
| Start alignment travel | ADJUST YES No | 3.4 |
| Network configuration address | SET ID | 5.1.1 |
| Resolution | RESOL | 4.2.1 |
| Decimal places | DEC PL | 4.2.2 |
| Counting direction | CntDIR | 4.2.3 |
| Target window | TW | 4.2.6 |
| Restart | RESET YES No | |
| Menu end | <QUIT> | |

Table 9: "QUICK SETUP" menu

3.3.1.7 EtherCAT

The following parameters can be set in the "Interface parameter" menu:

| Description | Display | Chapter |
|-------------------------------|---------|-----------------------|
| Network configuration address | SET ID | 5.1.1 |
| Restart | RESET | |

| Description | Display | Chapter |
|-------------|-----------|---------|
| Selection | YES No | |
| Menu end | <QUIT> | |

Table 10: "EtherCAT" menu

3.3.1.8 Positioning

The following parameters can be set in the "Positioning" menu:

| Description | Display | Chapter |
|-------------------------|---------------------|------------------------|
| Resolution | RESOL | 4.2.1 |
| Decimal places | DEC PL | 4.2.2 |
| Display divisor | DISDIV | 4.5.10 |
| Counting direction | CntDIR | 4.2.3 |
| Enter calibration value | CALVAL | 4.2.4 |
| Calibrate selection | CALVAL YES No | |
| Application Offset | OFFSET | 4.2.5 |
| Target window | TW | 4.2.6 |
| Extended target window | TWX | 4.2.7 |
| Loop positioning | LOOP | 4.2.8 |
| Loop length | LOOP L | 4.2.9 |
| Menu end | <QUIT> | |

Table 11: "Positioning" menu

3.3.1.9 Visualization

The following parameters can be set in the "Visualization" menu:

| Description | Display | Chapter |
|-----------------------------------------|---------|-----------------------|
| Display orientation | DISPL | 4.3.1 |
| Visualization of extended target window | TWXVIS | 4.3.4 |
| Adjustment direction indicator | INDICA | 4.3.2 |
| Display in the 2 nd row | DLINE2 | 4.3.3 |
| White display backlight | BL WT | 4.3.5 |
| Red display backlight | BL RD | 4.3.6 |
| Display backlight blinking | BL FL | 4.3.7 |
| Menu end | <QUIT> | |

Table 12: "Visualization" menu

3.3.1.10 LED function

The following parameters can be set in the "LED function" menu:

| Description | Display | Chapter |
|--------------|---------|-----------------------|
| LED1 green | LED1GN | 4.4.1 |
| LED1 red | LED1RD | 4.4.2 |
| LED2 green | LED2GN | 4.4.3 |
| LED2 red | LED2RD | 4.4.4 |
| LED blinking | LED FL | 4.4.5 |
| Menu end | <QUIT> | |

Table 13: LED function" menu

3.3.1.11 Device options

The following parameters can be set in the "Additional device options" menu:

| Description | Display | Chapter |
|------------------------------------------|---------------------|------------------------|
| Restart Selection | RESET YES No | |
| Key enable time / parameterization delay | K TIME | 4.5.12 |
| Sensor type | SENSOR | 4.5.2 |
| Start alignment travel selection | ADJUST YES No | 3.4 |
| Calibration enable | K CAL | 4.5.14 |
| Incremental measurement enable | K INC | 4.5.15 |
| Type of difference calculation | DIFFMD | 4.5.8 |
| Operating mode | OPMoDE | 4.5.1 |
| Display factor | D FACT | 4.5.9 |
| Application of the display divisor | DDIVMD | 4.5.11 |
| Acknowledgment mode | K ACKN | 4.5.16 |
| Mapping channel assignment | GEMAPA | 4.5.19 |
| Change the PIN | PIN | 4.5.17 |
| Load the factory setting | LOAD P | 3.7.3 |
| Input mask for command codes | CODE | 4.5.18 |
| Menu end | <QUIT> | |

Table 14: "Additional device options" menu

3.3.2 Parameterization via interface

The position indicator can be completely parameterized in the interface (see chapter [5](#)).

3.4

Sensor

NOTICE

Alignment travel is required if a new sensor is connected (see chapter [3.5](#)).

Mounting of the sensors as well as installation of the sensor cable is explained in the documentation pertaining to the sensor MS500H or GS04. With 24 V supply voltage operation the display controls the connected sensor. If no sensor is connected or if the sensor is lifted from the tape (MS500H), an error will be detected and the position value displayed red with flashing "Error". This status persists even with power supply failure. The error must be corrected after checking the sensor connection or sensor position with calibration (see chapter [2.4](#) and chapter [3.6](#)). If both battery supply and power supply fail simultaneously (e. g. during a battery change), the absolute position value can get lost. For making the measuring system work again, calibration is required (see also chapter [3.8](#) and [3.6](#)).

3.5

Alignment travel

The AP20S is fully functional as delivered. To adjust the display to the connected sensor and to achieve optimum measuring accuracy, alignment travel must be carried out whenever a new/different sensor is connected to the AP20S. For calibration, the sensor must have been mounted correctly (see documentation MS500H or GS04).

1. By entering CODE 000100, AP20S is set to the alignment mode (see chapter [3.3.1](#)).

Display: 1st line "ADJUST"
 2nd line "100" this value may vary by ± 1 .
2. When connecting sensor MS500H, it must be moved by a few millimeters in the direction of the cable outlet (speed <1 cm/s).
 When connecting sensor GS04, the shaft must be rotated clockwise by a few millimeters (speed <<1 U/min).
 In the lower line, the value will change in positive direction up to "103".
3. The alignment process will be completed when this value is finally exceeded. AP20S has returned to normal operation and shows the corresponding display. If values above "103" are displayed during alignment, then traversing speed must be slowed down during alignment.
4. It is not unusual that the position value cannot be displayed immediately after alignment travel and "FULL" is displayed instead of the value. The display should be calibrated in this case (see chapter [3.6](#)).

3.6

Calibration

Two steps are required for executing calibration:

1. Write calibration value (see parameter [Calibration Value](#))
2. Execute calibration (reset) (via control keys see chapter [2.4](#) or control word Bit 0 = 1 see chapter [3.1.2](#))

Since the measuring system is an absolute system, calibration is necessary only once with commissioning. With calibration, the calibration value is adopted for calculation of the actual value. In the case of calibration (time), the following applies:

Actual value = 0 + calibration value + offset value

Calibration value (see chapter [4.2.4](#))

Offset value (see chapter [4.2.5](#))

3.7 Additional functions

3.7.1 Device data

The following values can be read in the "Read Only" menu:

| Description | Display | Chapter |
|--------------------------------------------------------|----------|-----------------------|
| Battery voltage | B Volt | 4.6.1 |
| Operating voltage | OPVolt | 4.6.2 |
| Device temperature | TEMP | |
| Display of the currently used calibration value | CALACT | |
| Firmware version number of application | SW APP | |
| Firmware version number of EIP module | SW RTE | |
| Serial number | SN DEV | |
| Production date alternating between year and day/month | P DATE | |
| ECT parameter | ECT INFO | |
| Device address | DEV ID | |

Table 15: "Device data" menu

3.7.2 Diagnosis

The AP20S features various diagnostic options, which can be selected from the "Diagnosis" submenu. The following diagnostic options are differentiated:

| Description | Display | Chapter |
|----------------------------|---------|-------------------------|
| Reading the error memories | Error | 3.7.2.1 |
| Presentation | PRSnt | 3.7.2.2 |

Table 16: "Diagnosis" menu

3.7.2.1 Reading the error memories

The error history can be output at this point.

The list "AP20S" contains faults detected by the device such as "Battery undervoltage" or "Timeout".

With errors occurring, the error number and overall quantity are output on the upper line. The error type appears in the bottom line. The error number 1 contains the oldest error. The most recent error is output with the highest error number. "noErr" appears if no errors have been detected so far.

The error memory of the AP20S can be deleted via the interface with "System command" with data content 8 (see chapter [4.5.22](#)).

3.7.2.2 Presentation

In presentation mode, a fixed target value (850) is set and validated. With it, the device function can be presented without having to specify a target value via an interface. In presentation mode, changes to parameters are not permanently changed in the device memory. Restarting the device will exit presentation mode and reset the device to the last valid configuration.

3.7.3 Restore factory settings

There are various options for restoring the factory settings of the device:

| Access | Coding | Factory settings are restored | |
|-----------------------------------------------------------------------------------|-----------------------------|-------------------------------|--------------------------------------|
| Manual 4.5.18 | CODE (chapter 4.5.18) | 11100 | all parameters |
| | | 11102 | all except bus parameters |
| | | 11105 | only bus parameters |
| | Load Default | All | all parameters |
| | | StAnd | all except bus parameters (standard) |
| | | NETWRK | only bus parameters |
| Interface (Parameter System Command see chapter 4.5.22) | FFh | 1 | all parameters |
| | | 2 | all except bus parameters |
| | | 3 | only bus parameters |

Table 17: Access to factory settings

3.8 Warnings / Errors

3.8.1 Warnings

Warnings do not influence the acquisition of the absolute actual value.
Warnings are deleted after removing the cause.

Possible warnings:

- Battery voltage for absolute position detection is below limit ⇒ immediately exchange battery!
This warning is displayed with a blinking battery symbol . Warning messages are output via the interface via the status word.

| Display | Bit assignment in the status word | Error |
|----------|-----------------------------------|----------------------------------------------------------------|
| flashing | Bit 11 | Low battery voltage (critical) Actual value is still valid! |

Table 18: Warnings

3.8.2 Errors

NOTICE

Calibration may also be required Depending on the error type.

Error states are signaled via display (written in red or battery symbol) and interface. To return to normal operation, the cause must be removed. Error signaling (display flashes red) can then be acknowledged or deleted with the  button or via the interface.

If calibration is required, this is indicated in the display as "CALIB REQUEST". Independent of acknowledgment of the error status.

| Display | Error code | | Bit assignment in the status word | Error |
|---------------------------------------------------------------------------------------------|----------------|------------|-----------------------------------------|-------------------------------------------------------|
| | ECT -Interface | Web server | | |
|  permanent | 0x0006h | 6 | Bit 11 & Bit 7 | Battery undervoltage (dead) |
| noMAGn | 0x000Fh | 15 | Bit 12 & Bit 7 | Tape-sensor gap exceeded |
| noSENS | 0x001Ah | 26 | Bit 12 & Bit 7 | No sensor connected |
| SPEED | 0x0019h | 25 | Bit 12 & Bit 7 | Travel speed exceeded |
| SEnSIC | 0x0020h | 26 | Bit 7 | Sensor chip error |
| TOCYcL | 0x0081h | 129 | Bit 7 | Timeout ECT interface |
| M WDER | 0x0014h | 20 | Bit 7 | Ethernet module "Watchdog" error |
| M ERRO | 0x0015h | 21 | Bit 7 | Error in Ethernet module runtime |
| M EXCE | 0x00FEh | 254 | Bit 7 | Error in the Ethernet module in the "Exception" state |
| None | 0x0013h | 19 | Bit 7 | EEPROM read/write error |

Table 19: Error messages

| Display | Error | Possible effect | Corrective actions |
|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|-------------------------------------|--------------------------------------------------|
|  permanent | Battery empty | Actual value not reliable | Battery change + calibration travel |
| noMAGn | Magnet distance too large | Measurement error or no measurement | Setting the sensor distance + calibration travel |
| noSENS | Sensor connection interrupted | Measurement error or no measurement | Check sensor connection + calibration travel |
| SPEED | Permissible travel speed exceeded (see installation instruction). Error may also occur during alignment travel. | Actual value not reliable | Traversing speed + calibration travel |
| SEnSIC | Communication sensor chip defective | Set point not reliable | Internal error |
| TOCYcL | Timeout in acyclic data exchange | Communication error | Check cycle time of the controller |
| M WDER | Ethernet-Module Watchdog | Communication error | Internal error |
| M ERRO | Ethernet module in the ERROR state during an active travel order | Communication error | Internal error |

| Display | Error | Possible effect | Corrective actions |
|---------|------------------------------------------|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| M EXCE | Ethernet module in the "Exception" state | Communication error | Internal error |
| None | EEPROM read/write error | | The behavior of the position display when this fault occurs can be determined with this parameter System Configuration, bit 6 (see chapter 4.5.20). |
| None | EEPROM read/write error | Incorrect parameterization at restart | Contact support |

Table 20: Corrective actions

A list of errors that occurred can be read in the Diagnosis/Error memory operating menu (see chapter [3.7.2.1](#)). This error memory can be deleted via the ECT interface with the system command FFh with data content.

4

Parameters

Parameters are classified. The classes E, N, S, V and PD can be separately reset to factory settings if necessary (see chapter [3.7.3](#)).

| Parameter classes | Character |
|--------------------------|-----------|
| Error memory | E |
| Network parameters | N |
| Standard parameters | S |
| Visualization parameters | V |
| Process data | PD |

| Chapter | starting with page |
|-----------------------|--------------------|
| Network configuration | 71 |
| Positioning | 30 |
| Visualization | 38 |
| LEDs | 42 |
| Options | 45 |
| Device information | 59 |
| Error memory | 65 |

Table 21: Parameter description

4.2 Positioning

4.2.1 Resolution

When the hollow shaft sensor is used, this parameter determines the number of measurement steps per revolution (display/revolution = APU). When the MS500H magnetic sensor is used, the resolution is in unit nm (nanometer).

For example, the setting 10000 at MS500H corresponds to a resolution of 1/100 mm (1 measuring step = 10 µm or 10000 nm).

General characteristics

| Sub-index | 00h |

Display

| | |
|------|---------------------------------|
| Menu | CntDIR (chPARA \ POSI \ CntDIR) |
|------|---------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 0 (default) |

Parameter selection GS04

| Value | Display | Description |
|-------|---------|-------------------|
| 0 | CW | clockwise |
| 1 | CCW | counter-clockwise |

CW counting direction: ascending position values with clockwise shaft rotation (CW, view on the display).

CCW counting direction: ascending position values with counter-clockwise shaft rotation (CCW, view on the display).

Parameter selection MS500H

| Value | Display | Description |
|-------|---------|---------------------------------|
| 0 | POS | in positive direction of travel |
| 1 | NEG | in negative direction of travel |

POS counting direction: ascending position values with corresponding change of the sensor position in the positive direction.

NEG counting direction: descending position values with a corresponding change in the sensor position in the positive direction.

The positive sensor orientation depends on the mounting type of the sensor. Observe the corresponding installation instructions of the sensor in this regard.

4.2.4 Calibration Value

The current calibration value is always displayed in the ReadOnly menu (see chapter [3.7.1](#)); it is always replaced with the parameter value only after an executed calibration.

To perform a calibration, the system command "Calibration" must be executed (see chapter [3.6](#)).

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | S |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER32 |
| Access | rw |
| Object | 202Eh |
| Sub-index | 00h |

Display

| | |
|------|---------------------------------|
| Menu | CALVAL (chPARA \ POSI \ CALVAL) |
|------|---------------------------------|

Data type INTEGER32

| | |
|-------------|--------------------|
| Value range | -999999 ... 999999 |
| Default | 0 (default) |

4.2.5 Offset Application

This parameter sets the offset value.

With the offset, it is possible to move the scaled value range. The offset value is added to the position value in the encoder. Both positive and negative values are permitted. Position value = measurement value + calibration value.

Parameters

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | S |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER16 |
| Access | rw |
| Object | 202Dh |
| Sub-index | 00h |

Display

| | |
|------|---------------------------------|
| Menu | OFFSET (chPARA \ POSI \ OFFSET) |
|------|---------------------------------|

Data type INTEGER16

| | |
|-------------|------------------|
| Value range | -29999 ... 29999 |
| Default | 0 (default) |

4.2.6 Target Window

If the actual value lies within the target window, the target value is reached.

General characteristics

| | |
|--------|------------|
| EEPROM | yes |
| Class | S |
| Unit | User units |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | rw |
| Object | 2032h |
| Sub-index | 00h |

Display

| | |
|------|-------------------------|
| Menu | TW (chPARA \ POSI \ TW) |
|------|-------------------------|

Data type UNSIGNED16

| | |
|-------------|-------------|
| Value range | 0 ... 9999 |
| Default | 5 (default) |

4.2.7 Target Window Extended

Extended target window for better positioning at high travel speed.

Parameters

General characteristics

| | |
|--------|------------|
| EEPROM | yes |
| Class | S |
| Unit | User units |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | rw |
| Object | 2033h |
| Sub-index | 00h |

Display

| | |
|------|---------------------------|
| Menu | TWX (chPARA \ POSI \ TWX) |
|------|---------------------------|

Data type UNSIGNED16

| | |
|-------------|-------------|
| Value range | 0 ... 9999 |
| Default | 0 (default) |

4.2.8 Loop Type

This parameter specifies the positioning type, the loop type. This selects the direction in which the target value is to be approached.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | S |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2030h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------|
| Menu | LOOP (chPARA \ POSI \ LOOP) |
|------|-----------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 2 |
| Default | 0 (default) |

Parameter selection GS04

| Value | Display | Description |
|-------|---------|-------------------|
| 0 | DIR | direct, no loop |
| 1 | CW | clockwise |
| 2 | CCW | counter-clockwise |

Parameter selection MS500H

| Value | Display | Description |
|-------|---------|----------------------|
| 0 | DIR | direct, no loop |
| 1 | POS | Positive travel loop |
| 2 | NEG | Negative travel loop |

The positive sensor orientation depends on the mounting type of the sensor. Observe the corresponding installation instructions of the sensor in this regard.

4.2.9 Loop Length

General characteristics

| | |
|--------|------------|
| EEPROM | yes |
| Class | S |
| Unit | User units |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | rw |
| Object | 2031h |
| Sub-index | 00h |

Display

| | |
|------|---------------------------------|
| Menu | LOOP L (chPARA \ POSI \ LOOP L) |
|------|---------------------------------|

Data type UINT

| | |
|-------------|-------------|
| Value range | 0 ... 9999 |
| Default | 0 (default) |

4.2.10 Control Word

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | PD |
| Unit | - |

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-------------------------------------|
| 0 | OFF | No flashing, LEDs light when active |
| 1 | ON | LEDs flash when active |

4.5 Options**4.5.1 Operating Mode**

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | S |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2037h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | OPMODE (chPARA \ OPTION \ OPMODE) |
|------|-----------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 3 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|----------------------------|
| 0 | ABSPOS | Absolute position |
| 1 | DIFF | Difference value |
| 2 | MODULO | Modulo (360°angle display) |
| 3 | DISPL | Alpha-numeric display |

4.5.2 Sensor Type

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | E |
| Unit | - |

Parameters

EtherCAT

| | |
|-----------|---------|
| Data type | USINT |
| Access | Get/Set |
| Object | 203Ch |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | OPMODE (chPARA \ OPTION \ SENSOR) |
|------|-----------------------------------|

Data type USINT

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|---------------------|
| 0 | MS500H | Magnetic sensor |
| 1 | GS04 | Hollow shaft sensor |

4.5.3 Display Data

If the target value is used for displaying (Display String Mode = 0), the data format can be selected between decimal or ASCII using the control word Bit8 Display data type and Bit9 Target value type.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | PD |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER32 |
| Access | rw |
| Object | 2002h |
| Sub-index | 00h |

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type INTEGER32

| | |
|-------------|-----------------------------------------|
| Value range | -2 ³¹ ... 2 ³¹ -1 |
| Default | 0 (default) |

4.5.4 Display String Mode

In the **alphanumeric display** mode, this parameter selects the data source for the display. The Display String Mode = 1 is set to display Display String1 and Display String2. This is only possible when the data type ASCII is active; for this purpose, Bit7 = 1 or Bit8 = 1 must be set in the control word. As a result, it is possible to display 6 ASCII characters per line. Otherwise, the Target Value process data and Display Data are displayed.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2039h |
| Sub-index | 00h |

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 0 (default) |

Parameter selection

| Value | Description |
|-------|-----------------------------------------------------------------------|
| 0 | Target Value process data and Display Data are used as display value. |
| 1 | Display String1 and Display String2 are shown on the display. |

4.5.5 Display String1

Data contents Line 1 with active display string mode.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | rw |
| Object | 203Ah |
| Sub-index | 00h |

Parameters

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type UNSIGNED32

| | |
|-------------|------------------|
| Value range | 0 ... 4294967295 |
| Default | 0 (default) |

4.5.6 Display String2

Data content line 2 with active display string mode.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | rw |
| Object | 203Bh |
| Sub-index | 00h |

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type UNSIGNED32

| | |
|-------------|------------------|
| Value range | 0 ... 4294967295 |
| Default | 0 (default) |

4.5.7 Difference Value

The difference value can be read with this parameter. The formation of the difference value is set with the Difference Value Mode parameter.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER32 |
| Access | ro |
| Object | 20C3h |
| Sub-index | 00h |

Parameters

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type INTEGER32

| | |
|-------------|----------------------|
| Value range | -5242880 ... 5242880 |
| Default | 0 (default) |

4.5.8 Difference Value Mode

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2043h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | DIFFMD (chPARA \ VISUAL \ DIFFMD) |
|------|-----------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|------------------------|
| 0 | POS-TA | DIFF = Actual - Target |
| 1 | TA-POS | DIFF = Target - Actual |

4.5.9 Display Factor

If a display factor > 0 is set, all values on the display are indicated in inch.

It should be noted that the transmission values from and to the interface are present in the metric system (depending on resolution and ADI). The control delivers target, calibration and offset values as well as loop length and target window metrically as well. Device-internal position monitoring is metrical. Therefore, the superordinate control can only function in the metric system. The values for position, target value and the differential value if applicable are calculated by means of the following formula (for position value):

$$\text{Display value} = \text{position value} \times \text{calculation factor}$$

$$\text{Calculation factor} = \frac{1}{0.254} \times 10^{4-\text{Display factor}}$$

9 different calculation factors can be set (see [Table 22](#)). The number of decimal places is selected via parameter Decimal Places.

| Display factor | Calculation factor | Meaning | Examples of indication (Resolution = 400) Position after 1 revolution = 400 |
|----------------|------------------------------------------------|-------------------------------------|--------------------------------------------------------------------------------|
| 0 | 1 | Metric indication after APU and ADI | 400 |
| 1 | $\frac{10^3}{0.254} = \frac{1000}{0.254}$ | Imperial indication (inch) | 1574803 |
| 2 | $\frac{10^2}{0.254} = \frac{100}{0.254}$ | | 157480 |
| 3 | $\frac{10^1}{0.254} = \frac{10}{0.254}$ | | 15748 |
| 4 | $\frac{10^0}{0.254} = \frac{1}{0.254}$ | | 1575 |
| 5 | $\frac{10^{-1}}{0.254} = \frac{0.1}{0.254}$ | | 158 |
| 6 | $\frac{10^{-2}}{0.254} = \frac{0.01}{0.254}$ | | 16 |
| 7 | $\frac{10^{-3}}{0.254} = \frac{0.001}{0.254}$ | | 2 |
| 8 | $\frac{10^{-4}}{0.254} = \frac{0.0001}{0.254}$ | | 0 |

Table 22: Value table of display factor

General characteristics

| | |
|--------|------------|
| EEPROM | yes |
| Class | S |
| Unit | User units |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2038h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | D FACT (chPARA \ OPTION \ D FACT) |
|------|-----------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 8 |
| Default | 0 (default) |

4.5.10 Display Divisor

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 201Ah |
| Sub-index | 00h |

Display

| | |
|------|---------------------------------|
| Menu | DISDIV (chPARA \ POSI \ DISDIV) |
|------|---------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 3 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-------------|
| 0 | 1 | 1 |
| 1 | 10 | 10 |
| 2 | 100 | 100 |
| 3 | 1000 | 1000 |

Examples:

(Application of the Display Divisor see chapter [4.3.4](#))

| Position value ascertained | DISDIV (12h) | DISDIVMOD-application (25h) | Display | Output interface | Target value received | Target attained |
|----------------------------|--------------|-----------------------------|---------|------------------|-----------------------|-----------------|
| 12348 | 2 | 0 | 123 | 123 | 123 | yes |
| 12348 | 2 | 1 | 123 | 12348 | 123 | yes |
| 12348 | 2 | 1 | 123 | 12348 | 12348 | no |
| 12348 | 1 | 2 | 1235 | 12348 | 12348 | yes |
| 12348 | 1 | 2 | 1235 | 12348 | 1235 | no |
| 12348 | 3 | 2 | 12 | 12348 | 12348 | yes |
| 12348 | 3 | 2 | 12 | 12348 | 1235 | no |

Table 23: ADI and ADI application

4.5.11 Display Divisor Mode

This parameter can be used to set the application of the display divisor for the determined position values (absolute position value, frozen position value) as well as the received target value (display divisor and examples see chapter [4.5.10](#)).

Parameters

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2042h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | DDIVMD (chPARA \ OPTION \ DDIVMD) |
|------|-----------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 2 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-----------------------------------------------------------------------------|
| 0 | ALL | Display, target value and interface output are calculated with the divisor. |
| 1 | DI+TAR | Display and target value are calculated with the divisor. |
| 2 | DISPL | Display is calculated with the divisor. |

4.5.12 Key Enable Time

This parameter sets the delay of the display of the parameter menu (release time buttons).

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2013h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | K TIME (chPARA \ OPTION \ K TIME) |
|------|-----------------------------------|

Parameters

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 1 ... 60 |
| Default | 5 (default) |

4.5.13 Key Configuration

With this parameter, the parameterization is enabled at pressing of a key.

If the configuration is locked, a CODE query is displayed instead to be able to unlock a locked position display manually (see chapter [3.7.3](#)).

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2016h |
| Sub-index | 00h |

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 1 (default) |

4.5.14 Key Calibration

This parameter specifies whether the calibration of the position value is enabled by pressing a key.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2014h |
| Sub-index | 00h |

Parameters

Display

| | |
|------|---------------------------------|
| Menu | K CAL (chPARA \ OPTION \ K CAL) |
|------|---------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 1 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-------------|
| 0 | DISABL | Blocked |
| 1 | ENABLE | Release |

4.5.15 Key Incremental

This parameter specifies whether the setting of the position value is enabled by pressing a key.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2015h |
| Sub-index | 00h |

Display

| | |
|------|---------------------------------|
| Menu | K INC (chPARA \ OPTION \ K INC) |
|------|---------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 1 |
| Default | 1 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-------------|
| 0 | DISABL | Blocked |
| 1 | ENABLE | Released |

4.5.16 Key Acknowledgment Mode

This parameter can be used to specify which key is to be used as an acknowledgment key. The setting is only relevant in the **alphanumeric display** mode. In this case, a received target value is displayed flashing until its reception is acknowledged by the pressing of a button.

Parameters

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 2018h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | K ACKN (chPARA \ OPTION \ K ACKN) |
|------|-----------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 2 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-----------------------------------------|
| 0 | ASTERX | Asterisk key \Leftrightarrow - key |
| 1 | ARROW | Arrow key \Leftrightarrow - and -key |

4.5.17 PIN Change

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | V |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER32 |
| Access | rw |
| Object | 2012h |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------|
| Menu | PIN (chPARA \ OPTION \ PIN) |
|------|-----------------------------|

Data type INTEGER32

| | |
|-------------|-------------|
| Value range | 0 ... 99999 |
| Default | 0 (default) |

4.5.18 CODE Input

The code can only be entered on the device. Either via the parameter menu options or with Key Configuration is the key is locked.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER32 |
| Access | wo |
| Object | - |
| Sub-index | 00h |

Display

| | |
|------|-------------------------------|
| Menu | CODE (chPARA \ OPTION \ CODE) |
|------|-------------------------------|

Data type INTEGER32

| | |
|-------------|--------------|
| Value range | 0 ... 999999 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|-----------------------------------------|
| 100 | 000100 | Start alignment process |
| 11100 | 011100 | Reset, all parameters |
| 11102 | 011102 | Reset, all, except interface parameters |
| 11105 | 011105 | Reset, interface parameters only |

4.5.19 Generic Mapping Parameter

This parameter defines the content of the generic mapping channel, which is part of the process data.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | N |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | rw |
| Object | 20 07 |
| Sub-index | 00h |

Parameters

Display

| | |
|------|---------------------------------|
| Menu | GEMAPA (chPARA \ OPTION \ CODE) |
|------|---------------------------------|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 8 |
| Default | 0 (default) |

Parameter selection

| Value | Display | Description |
|-------|---------|------------------------------------|
| 0 | TARGET | Target Value |
| 1 | OPVOLT | Operating voltage |
| 2 | B VOLT | Battery voltage |
| 3 | SPEED | Sensor speed |
| 4 | SENADC | Sensor raw data |
| 5 | PERCNT | Sensor rough value |
| 6 | OPTIME | Operating hours |
| 7 | DIFF | Difference value depending on mode |
| 8 | TEMP | Temperature |

4.5.20 System Configuration

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | S |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | rw |
| Object | 20FEh |
| Sub-index | 00h |

Display

| | |
|------|-----------------------------------|
| Menu | SYSCON (chPARA \ OPTION \ SYSCON) |
|------|-----------------------------------|

Data type UNSIGNED16

| | |
|-------------|--------------|
| Value range | 0 ... 127 |
| Default | 15 (default) |

Parameter selection

| Bit | Description |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------|
| 0 | SHICP (Secure Host IP Configuration Protocol) 0 = switched off 1 = switched on (default) Changes are only adopted after reset. |

| Bit | Description |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Web server 0 = switched off 1 = switched on (default) Changes are only adopted after reset. |
| 2 | Parameter access via web server 0 = switched off 1 = switched on (default) Changes are only adopted after reset. |
| 3 | FTP Server 0 = switched off 1 = switched on (default) Changes are only adopted after reset. |
| 4 | FTP Server administrator rights 0 = no (default) 1 = yes Changes are only adopted after reset. |
| 5 | Reserved, ever 0 |
| 6 | Auto reset in the EXCEPTION state 0 = switched off (default): In the EXCEPTION state, the position indicator stops participating in network traffic and can no longer be addressed. To exit this state, a Power On Reset is required. 1 = switched on: In the EXCEPTION state, the position indicator automatically performs a reset. After the restart, the EXCEPTION fault is triggered. |
| 7 ... 15 | Reserved, ever 0 |

4.5.21 Module Parameters

This parameter module parameters is for internal purposes only, and may not be described.

General characteristics

| | |
|--------|----|
| EEPROM | no |
|--------|----|

4.5.22 System Command

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | wo |
| Object | 20FFh |
| Sub-index | 00h |

Parameters

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type UNSIGNED8

| | |
|-------------|-------------|
| Value range | 0 ... 100 |
| Default | 0 (default) |

Parameter selection

| Value | Description |
|-------|------------------------------------------------------------------|
| 1 | Set all parameters to factory settings |
| 2 | Only set standard parameters to factory settings |
| 3 | Set all parameters except the bus parameters to factory settings |
| 6 | Acknowledge error |
| 7 | Calibrate |
| 8 | Delete error memory |
| 9 | Software reset (warm start) |
| 100 | Start sensor alignment |

4.6 Device information

4.6.1 Battery Voltage

This parameter can be used to read the battery voltage. The voltage is output in 10 mV resolution.

General characteristics

| | |
|--------|------|
| EEPROM | no |
| Class | - |
| Unit | Volt |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | ro |
| Object | 20C4h |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | B VOLT (RdOnLY \ B VOLT) |
|------|--------------------------|

Data type UNSIGNED16

| | |
|-------------|-------------|
| Value range | 0 ... 65535 |
| Default | 0 (default) |

4.6.2 Operation Voltage

This parameter can be used to read the operating voltage. The voltage is output in 10 mV resolution.

General characteristics

| | |
|--------|------|
| EEPROM | no |
| Class | - |
| Unit | Volt |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | ro |
| Object | 20C5h |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | OPVOLT (RdOnLY \ OPVOLT) |
|------|--------------------------|

Data type UNSIGNED16

| | |
|-------------|-------------|
| Value range | 0 ... 65535 |
| Default | 0 (default) |

4.6.3 Temperature

The device temperature can be read in the Readonly menu and in the Generic Generic Mapping Channel. The temperature is output in 0.1 °C resolution.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | - |
| Unit | °C |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | - |
| Object | - |
| Sub-index | 00h |

Display

| | |
|------|----------------------|
| Menu | TEMP (RdOnLY \ TEMP) |
|------|----------------------|

Data type UNSIGNED16

| | |
|-------------|-------------|
| Value range | 0 ... 65535 |
| Default | 0 (default) |

4.6.4 Actual Calibration Value

The Readonly menu displays the currently used calibration value, regardless of the Calibration Value (see chapter [4.2.4](#)), only after a calibration to the current calibration value has been carried out.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | S |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | - |
| Object | - |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | ACTCAL (RdOnLY \ ACTCAL) |
|------|--------------------------|

Data type UNSIGNED32

| | |
|-------------|--------------------|
| Value range | -999999 ... 999999 |
| Default | 0 (default) |

4.6.5 Software Version Application

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED16 |
| Access | ro |
| Object | 2062h |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | SW APP (RdOnLY \ SW APP) |
|------|--------------------------|

Data type UNSIGNED16

| | |
|-------------|-------------|
| Value range | 1 ... 999 |
| Default | 1 (default) |

4.6.6 Software Version Ethernet Module

The version is displayed as a 3 byte value xxh:xxh:xxh.

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | - |
| Object | - |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | SW RTE (RdOnLY \ SW RTE) |
|------|--------------------------|

Data type UNSIGNED32

| | |
|-------------|------------------|
| Value range | 0 ... 4294967295 |
| Default | - |

4.6.7 Serial Number

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | ro |
| Object | 2063h |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | SN DEV (RdOnLY \ SN DEV) |
|------|--------------------------|

Data type UNSIGNED32

| | |
|-------------|------------------|
| Value range | 0 ... 4294967295 |
| Default | 0 (default) |

4.6.8 Production Date

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | ro |
| Object | 2064h |
| Sub-index | 00h |

Display

| | |
|------|--------------------------|
| Menu | P DATE (RdOnLY \ P DATE) |
|------|--------------------------|

Data type UNSIGNED32

| | |
|-------------|------------------|
| Value range | 0 ... 4294967295 |
| Default | 0 (default) |

4.6.9 MAC Address

The 3 bytes of the 6 byte large MAC address is displayed alternately.

MAC LO corresponds to the 3 lower bytes of the MAC address.

MAC HI corresponds to the 3 higher bytes of the MAC address.

General characteristics

| | |
|--------|----------------------|
| EEPROM | yes (network module) |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | - |
| Object | - |
| Sub-index | 00h |

Display

| | |
|------|---------------------------------------|
| Menu | MAC LO(HI) (RdOnLY \ MAC LO , MAC HI) |
|------|---------------------------------------|

Data type UNSIGNED32

| | |
|-------------|------------------|
| Value range | 0 ... 4294967295 |
| Default | 0 (default) |

4.6.10 Device Identification

General characteristics

| | |
|--------|-----|
| EEPROM | yes |
| Class | - |
| Unit | - |

EtherCAT

| | |
|-----------|------------|
| Data type | UNSIGNED32 |
| Access | ro |
| Object | 2061h |
| Sub-index | 00h |

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type UNSIGNED32

| | |
|-------------|---------------------|
| Value range | 1 ... 8 |
| Default | 4 (default) = AP20S |

4.6.11 Generic Mapping Channel

In the general data channel, device information can be transmitted as part of the process data.

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | PD |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | INTEGER32 |
| Access | ro |
| Object | 2007h |
| Sub-index | 00h |

Display

| | |
|------|--|
| Menu | |
|------|--|

Data type INTEGER32

| | |
|-------------|----------------------------|
| Value range | -2147483648 ... 2147483647 |
| Default | 0 (default) |

4.7 Error Memory

Error display see chapter [3.7.2.1](#). The current error can be found under the parameter name 08h, and the most recent fault under the highest address. Error types see [Table 19](#).

4.7.1 Error Count

See chapter [3.8](#).

General characteristics

| | |
|--------|----|
| EEPROM | no |
| Class | E |
| Unit | - |

EtherCAT

| | |
|-----------|-----------|
| Data type | UNSIGNED8 |
| Access | ro |
| Object | 2080h |
| Sub-index | 00h |

Display

| | |

5 EtherCAT®

5.1 Description

The position indicator has been designed as CIP Generic Device (Type 2Bh).

The position indicator is an EtherCAT® slave. The position indicator supports the CANopen over EtherCAT protocol (CoE) according to the DS301 communication profile.

5.1.1 Configuration

NOTICE

The Explicit Device ID can be reset to the factory setting by an System-Command (see chapter [4.5.22](#)).
The Explicit Device ID is assigned to the parameter class N.

The Explicit Device ID is set via the display menu chPARA \ SETEIP \ SET NW. The value can be set in the range of 0 ... 255. In the factory setting, the Explicit Device ID is set to 0.

The IP configuration is in the chPARA \ SETECT display menu:

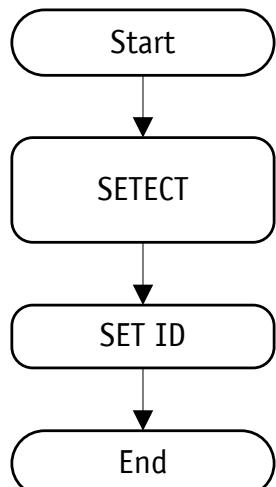

Fig. 7: Setting of the Device ID

5.1.2 Cyclic data exchange

Cyclic process data is exchanged via PDO-Frames. Mapping is static and cannot be changed.

5.1.3 Acyclic data exchange

Acyclic data is exchanged via SDO frames.

5.1.4 Operating modes and synchronization

The position indicator supports only the Free Run operating mode. The position indicator is not synchronized.

5.1.5 Emergency Messages

Any errors occurring trigger emergency messages in the position indicator, which are sent to the EtherCAT® master via mailbox communication. An internal fault code of the display is converted to the Emergency Error Code according to the following table, which is transmitted as part of the CoE Emergency Frames.

| Error code | Emergency Error Code | Description |
|------------|----------------------|----------------------------------------|
| 06h | FF06h | Battery voltage too low |
| 0Fh | FF0Fh | Magnetic distance too large |
| 10h | FF10h | EEPROM queue overrun |
| 13h | FF13h | EEPROM plausibility |
| 14h | FF14h | Ethernet module watchdog |
| 15h | FF15h | Ethernet module in ERROR state |
| 16h | FF16h | Ethernet module in the EXCEPTION state |
| 17h | FF17h | Timeout in acyclic data |
| 19h | FF19h | Travel speed too high |
| 1Ah | FF1Ah | Sensor faulty/missing |
| 1Ch | FF1Ch | Sensor error combined |
| 20h | FF20h | SPI internal communication |
| 80h | FF80h | Service interface error |

5.2 Directory of objects (CANopen over EtherCAT®)

5.2.1 Parameter description of standard objects

5.2.1.1 1000h: Device Type

| | |
|-------------|-------------------------|
| Sub-index | 00h |
| Description | Device profile |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0000 0000h (no profile) |

5.2.1.2 1001h: ErrorRegister

| | |
|-------------|----------------|
| Sub-index | 00h |
| Description | Error register |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 00h |

5.2.1.3 1003h: Pre-defined Error Field

| | |
|-------------|------------------|
| Sub-index | 00h |
| Description | Number of Errors |
| Access | rw |
| Data type | UNSIGNED8 |
| Default | 0 |

| | |
|-------------|------------|
| Sub-index | 01h – 05h |
| Description | Error 1-5 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | no |

5.2.1.4 1008h: Manufacturer Device Name

| | |
|-------------|-----------------------------|
| Sub-index | 00h |
| Description | Device name |
| Access | ro |
| Data type | VISIBLE_STRING64 |
| Default | Device-dependent "AP20S" |

5.2.1.5 1009h: Manufacturer Hardware Version

| | |
|-------------|------------------|
| Sub-index | 00h |
| Description | Hardware version |
| Access | ro |
| Data type | VISIBLE_STRING |
| Default | "HW_01.00" |

5.2.1.6 100Ah: Manufacturer Software Version

| | |
|-------------|------------------|
| Sub-index | 00h |
| Description | Software version |
| Access | ro |
| Data type | VISIBLE_STRING |
| Default | "SW_01.01" |

5.2.1.7 1011h: Restore Default Parameters

| | |
|-------------|-----------------------------|
| Sub-index | 00h |
| Description | Highest Sub-index Supported |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 01h |

| | |
|-------------|--------------------------------|
| Sub-index | 01h |
| Description | Restore All Default Parameters |
| Access | rw |
| Data type | UNSIGNED32 |
| Default | no |

5.2.1.8 1018h: Identity Object

| | |
|-------------|-------------------|
| Sub-index | 00h |
| Description | Number of Entries |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 04h |

| | |
|-------------|------------------------|
| Sub-index | 01h |
| Description | Vendor ID |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0000 0195h (SIKO GmbH) |

| | |
|-------------|--------------------|
| Sub-index | 02h |
| Description | Product Code |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0002 0100h (AP20S) |

| | |
|-------------|-------------------------|
| Sub-index | 03h |
| Description | Revision Number |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | Current revision number |

| | |
|-------------|-----------------------------|
| Sub-index | 04h |
| Description | Serial Number |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | Serial number of the device |

5.2.1.9 1600h: Receive PDO Mapping

| | |
|-------------|-------------------|
| Sub-index | 00h |
| Description | Number of Entries |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 03h |

| | |
|-------------|-------------------|
| Sub-index | 01h |
| Description | Mapped Object 001 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2003 0020h |

| | |
|-------------|-------------------|
| Sub-index | 02h |
| Description | Mapped Object 002 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2002 0010h |

| | |
|-------------|-------------------|
| Sub-index | 03h |
| Description | Mapped Object 003 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2001 0010h |

5.2.1.10 1A00h: Transmit PDO Mapping

| | |
|-------------|-------------------|
| Sub-index | 00h |
| Description | Number of Entries |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 04h |

| | |
|-------------|-------------------|
| Sub-index | 01h |
| Description | Mapped Object 001 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2103 0020h |

| | |
|-------------|-------------------|
| Sub-index | 02h |
| Description | Mapped Object 002 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2104 0020h |

| | |
|-------------|-------------------|
| Sub-index | 03h |
| Description | Mapped Object 003 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2102 0010h |

| | |
|-------------|-------------------|
| Sub-index | 04h |
| Description | Mapped Object 004 |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 2101 0010h |

5.2.1.11 1C00h: Sync Manager Communication Type

| | |
|-------------|-------------------|
| Sub-index | 00h |
| Description | Number of Entries |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 04h |

| | |
|-------------|-----------------------------------|
| Sub-index | 01h |
| Description | Communication Type Sync Manager 0 |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 1 (Mailbox wr, Master -> Slave) |

| | |
|-------------|-----------------------------------|
| Sub-index | 02h |
| Description | Communication Type Sync Manager 1 |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 2 (Mailbox rd, Slave -> Master) |

| | |
|-------------|-----------------------------------|
| Sub-index | 03h |
| Description | Communication Type Sync Manager 2 |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 3 (Rx PDO, Master -> Slave) |

| | |
|-------------|-----------------------------------|
| Sub-index | 04h |
| Description | Communication Type Sync Manager 3 |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 4 (Tx PDO, Slave -> Master) |

5.2.1.12 1C12h: Sync Manager Rx PDO Assign

| | |
|-------------|-------------------------|
| Sub-index | 00h |
| Description | Number of Assigned PDOs |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 01h |

| | |
|-------------|---------------------------------------------|
| Sub-index | 01h |
| Description | PDO Mapping Object Number of Assigned RxPDO |
| Access | ro |
| Data type | UNSIGNED16 |
| Default | 1600h |

5.2.1.13 1C13h: Sync Manager Tx PDO Assign

| | |
|-------------|-------------------------|
| Sub-index | 00h |
| Description | Number of Assigned PDOs |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 01h |

| | |
|-------------|---------------------------------------------|
| Sub-index | 01h |
| Description | PDO Mapping Object Number of Assigned TxPDO |
| Access | ro |
| Data type | UNSIGNED16 |
| Default | 1A00h |

5.2.1.14 1F32h: SM Output Parameter

| | |
|-------------|-----------------------------|
| Sub-index | 00h |
| Description | Highest Sub-index Supported |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 0Ch |

| | |
|-------------|----------------|
| Sub-index | 01h |
| Description | Sync Mode |
| Access | rw |
| Data type | UNSIGNED16 |
| Default | 00h (Free Run) |

| | |
|-------------|-------------------------|
| Sub-index | 02h |
| Description | Cycle Time |
| Access | rw |
| Data type | UNSIGNED32 |
| Default | 001E 8480h (2000000 ns) |

| | |
|-------------|------------|
| Sub-index | 03h |
| Description | Shift Time |
| Access | rw |
| Data type | UNSIGNED32 |
| Default | 0 |

| | |
|-------------|---------------------------------|
| Sub-index | 04h |
| Description | Synchronization Types Supported |
| Access | ro |
| Data type | UNSIGNED16 |
| Default | 0001h (Free Run) |

| | |
|-------------|------------------------|
| Sub-index | 05h |
| Description | Minimum Cycle Time |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0001 86A0h (100000 ns) |

| | |
|-------------|---------------------|
| Sub-index | 06h |
| Description | Calc and Copy Time |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0000 01F5h (500 ns) |

| | |
|-------------|------------|
| Sub-index | 09h |
| Description | Delay Time |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0 |

| | |
|-------------|----------------------|
| Sub-index | 0Ch |
| Description | Cycle Time Too Small |
| Access | ro |
| Data type | UNSIGNED16 |
| Default | 0 |

5.2.1.15 1F33h: SM Input Parameter

| | |
|-------------|-----------------------------|
| Sub-index | 00h |
| Description | Highest Sub-index Supported |
| Access | ro |
| Data type | UNSIGNED8 |
| Default | 0Ch |

| | |
|-------------|----------------|
| Sub-index | 01h |
| Description | Sync Mode |
| Access | rw |
| Data type | UNSIGNED16 |
| Default | 00h (Free Run) |

| | |
|-------------|-------------------------|
| Sub-index | 02h |
| Description | Cycle Time |
| Access | rw |
| Data type | UNSIGNED32 |
| Default | 001E 8480h (2000000 ns) |

| | |
|-------------|------------|
| Sub-index | 03h |
| Description | Shift Time |
| Access | rw |
| Data type | UNSIGNED32 |
| Default | 0 |

| | |
|-------------|---------------------------------|
| Sub-index | 04h |
| Description | Synchronization Types Supported |
| Access | ro |
| Data type | UNSIGNED16 |
| Default | 0001h (Free Run) |

| | |
|-------------|------------------------|
| Sub-index | 05h |
| Description | Minimum Cycle Time |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0001 86A0h (100000 ns) |

| | |
|-------------|---------------------|
| Sub-index | 06h |
| Description | Calc and Copy Time |
| Access | ro |
| Data type | UNSIGNED32 |
| Default | 0000 01F5h (500 ns) |

| | |
|-------------|----------------------|
| Sub-index | 0Ch |
| Description | Cycle Time Too Small |
| Access | ro |
| Data type | UNSIGNED16 |
| Default | 0 |

5.2.2 Parameter description of manufacturer-specific objects

See chapter [4](#).

5.3 Commissioning aids

Service software, functional module or example projects including step-by-step instructions are available as commissioning aids.
