FERTILIZERS

NOVU-K - Potassium Sulphate

NOVU-K is an unique fertilizer because of its multiple content of nutrients, Potassium (14%), Calcium (17%), Magnesium (6%) and Sulfur (48%). All nutrients are present in the form of sulfate, are readily water-soluble and therefore immediately available to the plants. NOVU-K is particularly suitable for chloride sensitive crops such as potatoes, vegetables, fruits and for crops cultivated under irrigation systems.

Application

It is particularly suitable for nutrient supply to chloride sensitive agricultural, horticultural and forestry crops due to its low chloride content. NOVU-K is available as a 2-4 mm granular product that can be applied as a single fertilizer or can be used in blends. It is often used in combination with straight nitrogen.
